Manual QA Report

rc-1

# Summary

- **Manual QA was conducted on rc-1 across three platforms by two browsers**
  - **Desktop:** Windows 10 / Google Chrome
  - **Mobile (portrait + landscape):** iOS / Safari
  - **Tablet:** iOS / Safari
- Functional problems categorized herein as **all-platform** or by specific platform
  - Proposed solutions to functional problems also provided

**All-Platform**

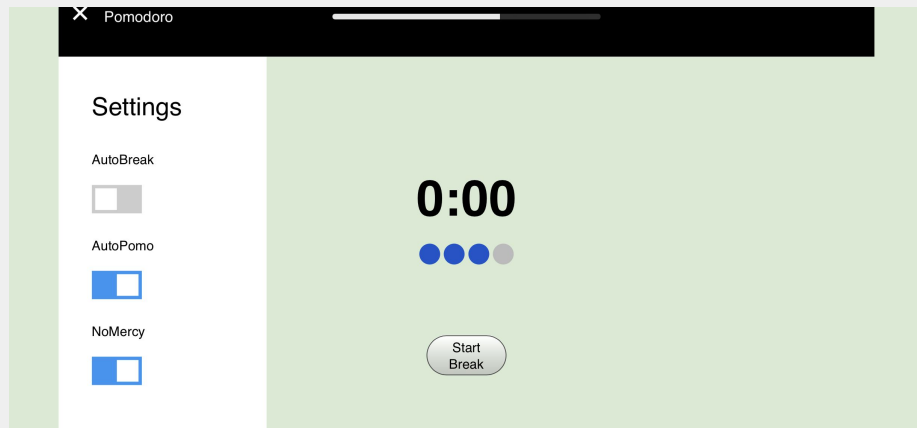

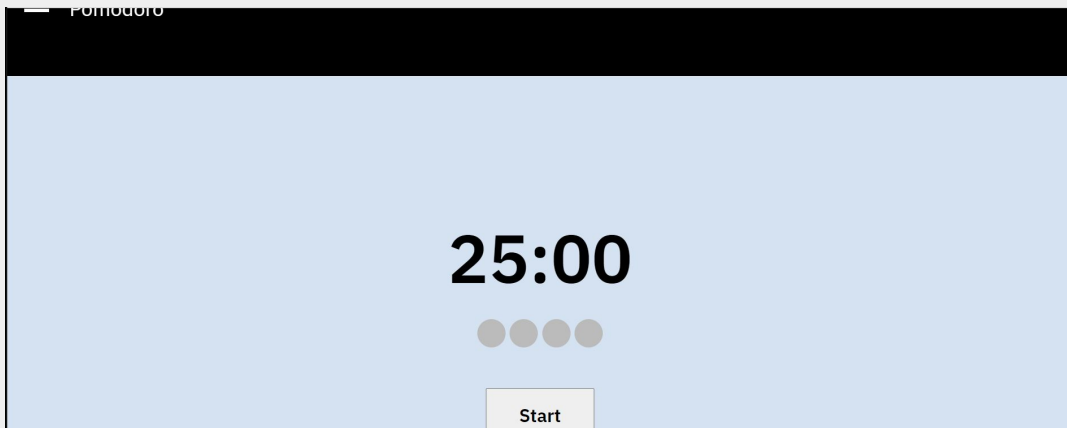

***Functional Problems***

# Problem 1:

Menu bar elements move  
onScroll when they should  
stay static

## Proposed Solution:

- Set position of icons to sticky or fixed

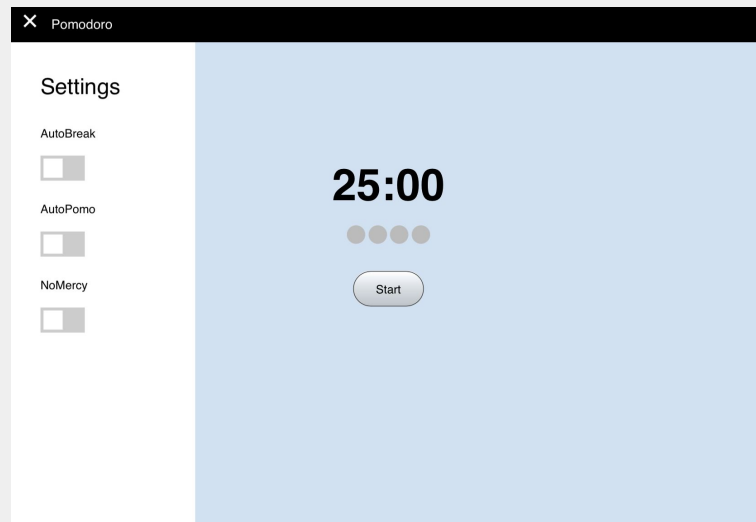

## Problem 2:

IBM Plex font does not  
render

### Proposed Solution:

- Make sure web fonts load from the web server, not user's machine

- It is defaulting to sans-serif when IBM Plex is not installed on machine

Tablet  
iOS / Safari

*Functional Problems*

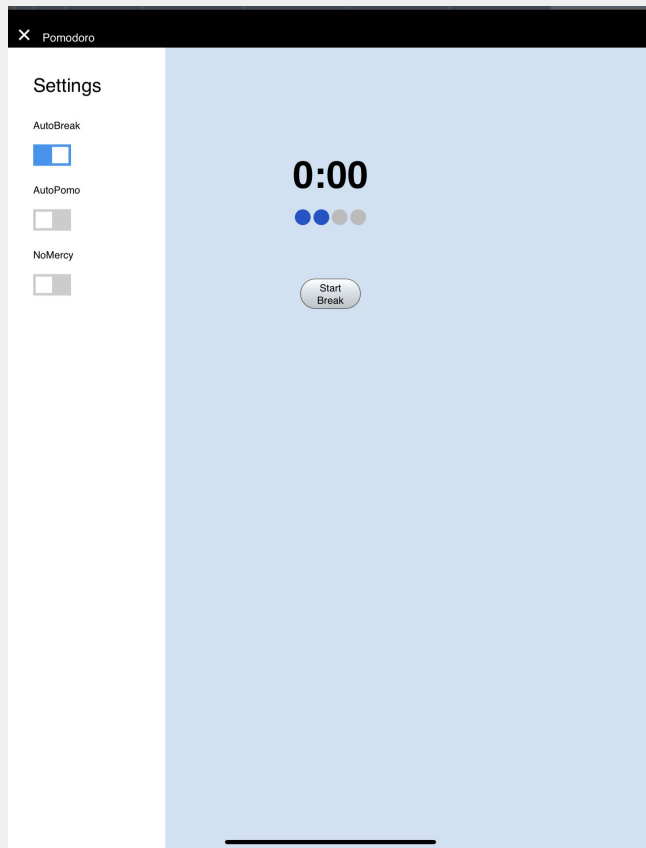

# None specifically!

Sidebar looks good on

tablet. Timer size is good

## Proposed Solution:

- Make sure to keep sidebar rules same as desktop for tablet breakpoint

# Mobile

## iOS / Safari + Android / Chrome

### *Functional Problems*

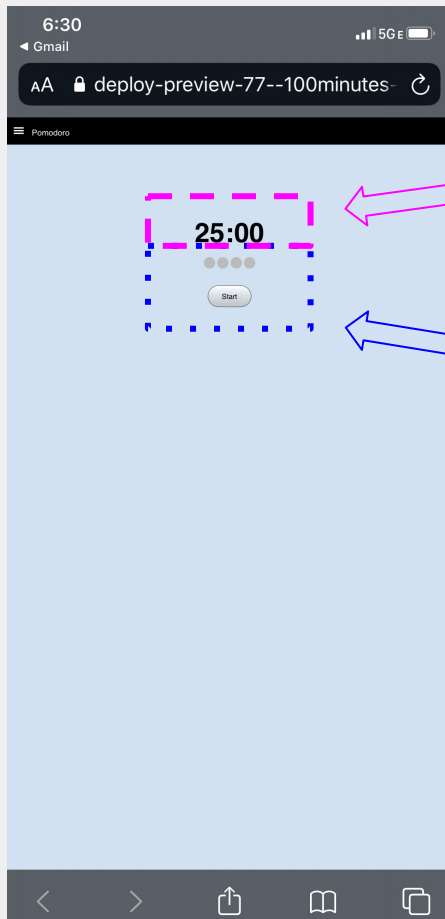

## Problem 3:

Timer too small, but  
height is ok (even on the  
tall iphone)

### Proposed Solution:

- Use dynamic sizing and disable shrink-to-fit for the viewport

For the right “feel,” the timer  
piece

Remainder of view should  
expand accordingly relative to  
clock piece

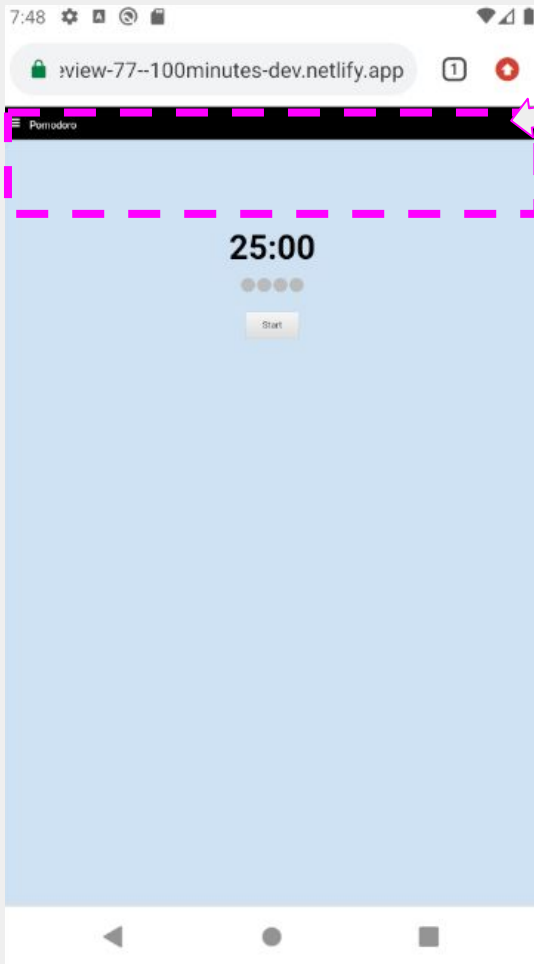

- For the right “feel,” the timer piece should be about 50% of width at this breakpoint... or about 2 thumbs-ish wide to feel right

## Problem 4:

Navigation bar much too small, “Pomodoro” title is almost unreadable.

### Proposed Solution:

- Scale up Nav bar height
- Scale up icons and titles

For the right “feel” here, nav bar should be 75% taller with the hamburger menu and title scaled up as well.
